Windows Firewall

This document describes how to setup the machine when you are using an operating system equipped with Windows Firewall, such as Windows XP Service Pack 2. Make sure that you read the information in this document thoroughly before using the machine.

Windows XP Service Pack 2 and other operating systems have the feature that blocks unauthorized access over the network to protect your computer (Windows Firewall). Because of this, you need to configure Windows Firewall to allow access when you are using the machine on an operating system that is equipped with Windows Firewall. The procedures and settings that you need to perform depend on your system environment.
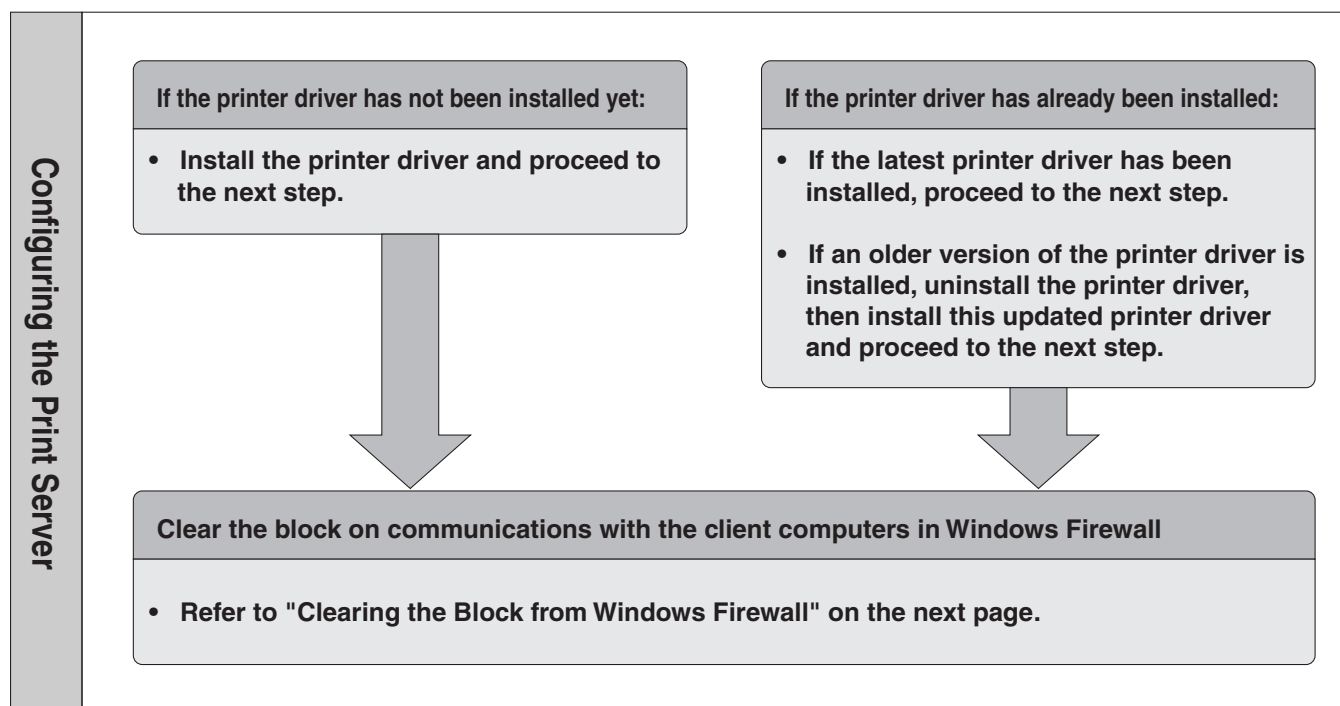

> The procedures and settings to use when the optional network board (AXIS 1610/1650) is installed are not contained in this manual. Refer to the Axis Communications website (http://www.axis.com/).

■ If you are not using a network environment (i.e. USB connection only)

If you are using the machine by connecting it directly to the computer using a USB cable, there are no particular steps that you need to take.

■ If you are using the printer in a network environment by using the print sharing function
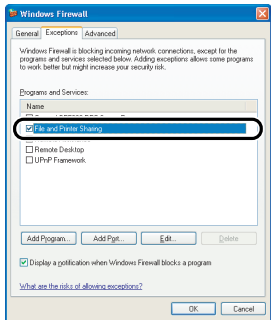

You need to perform the following procedure on the print server (the computer that is directly connected to the machine) and the client (the computer that accesses the printer via the network).

Configuring the Print Server

If the printer driver has not been installed yet:

- Install the printer driver and proceed to the next step.

If the printer driver has already been installed:

- If the latest printer driver has been installed, proceed to the next step.

- If an older version of the printer driver is installed, uninstall the printer driver, then install this updated printer driver and proceed to the next step.

Clear the block on communications with the client computers in Windows Firewall

- Refer to "Clearing the Block from Windows Firewall" on the next page.

Configuring the Client

Configure the following settings on the client computer. If you do not configure the following settings, some of the printer functions will not operate correctly.

① Select [Control Panel] from the [Start] menu, and then click [Network and Internet Connections] → [Windows Firewall].
② On the [Exceptions] sheet in the [Windows Firewall] dialog box, place a checkmark next to [File and Printer Sharing], and click the [OK] button.

Clearing the Block from Windows Firewall

If your print server is installed with an operating system equipped with Windows Firewall, such as Windows XP Service Pack 2, you need to configure Windows Firewall to allow communication between the print server and client computers. This section explains how to use the [CAPT Windows Firewall Utility] to configure Windows Firewall to unblock communication with client computers.

1 Start the [CAPT Windows Firewall Utility].

● If you are using a printer driver that you downloaded

① If uncompress the downloaded file, a folder is created.

② Double-click the created folder → [WF_UTIL] → [xxxxFW.EXE]. (where xxxx varies depending on your machine model.)

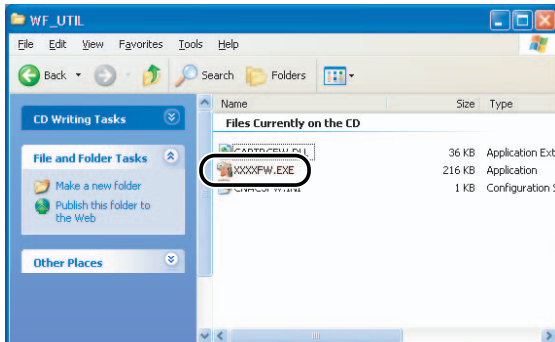

● If you are using the CD-ROM that came with the machine

① Insert the accompanying CD-ROM into the CD-ROM drive.

② Select [My Computer] from the [Start] menu, then right-click the CD-ROM icon and select [Open] from the popup menu.

③ Double-click [English] followed by [WF_UTIL] and then [xxxxFW.EXE]. (Where xxxx varies depending on your machine model.)
The [CAPT Windows Firewall Utility] starts up.

* If there is no [WF_UTIL] folder on the CD-ROM you are using, you will need to download the printer driver from the Canon website and reinstall the printer driver.

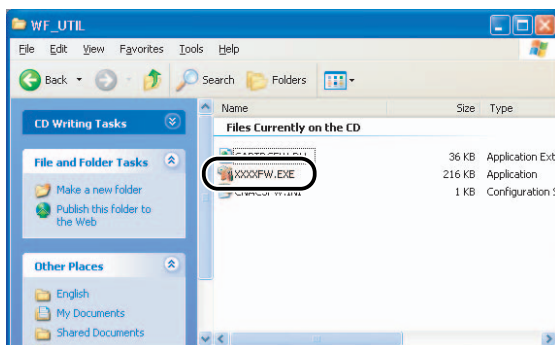

2 Click [Unblock].
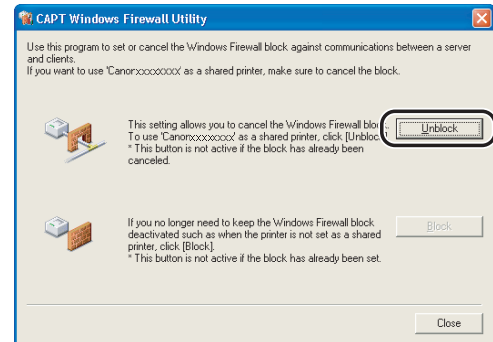

* Where xxxxxxxx varies depending on your machine model.

You cannot click [Unblock] if the firewall is currently configured to unblock communication with client computers.

3 Click [OK].

📝 NOTE

To verify that the Windows Firewall block has been properly cleared, select [Control Panel] from the [Start] menu, and then click [Network and Internet Connections] → [Windows Firewall]. Confirm that there is a checkmark next to [Canon xxxxxxxx RPC Server Process] on the [Exceptions] sheet in the [Windows Firewall] dialog box. (where xxxxxxxx varies depending on your machine model.)
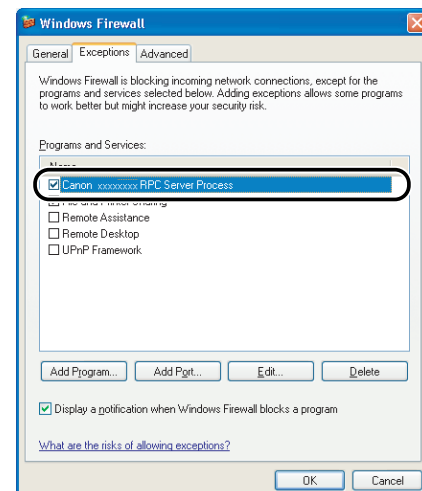

Windows Firewall is now configured to unblock communication with client computers.
